

GeoCP™ (Catalogued Photos) makes viewing photo collections easier than ever. This tool creates a thumbnail gallery organized by subfolders for a quick high-level preview of the photos and their structure. All photos can have their location referenced through a map view to show where and when the photos were taken.

Benefits

- GeoCP™ is a web application designed to help you
- Find photos in project folders by geospatial location
- Create maps for all spatially referenced photos
- View photo thumbnails and map view simultaneously
- Synchronize added photos in projects quickly
- Access advanced tools for tagging, filtering, and exporting images
- Leverage the Cloud for public GeoCP™ project sharing

How It Works

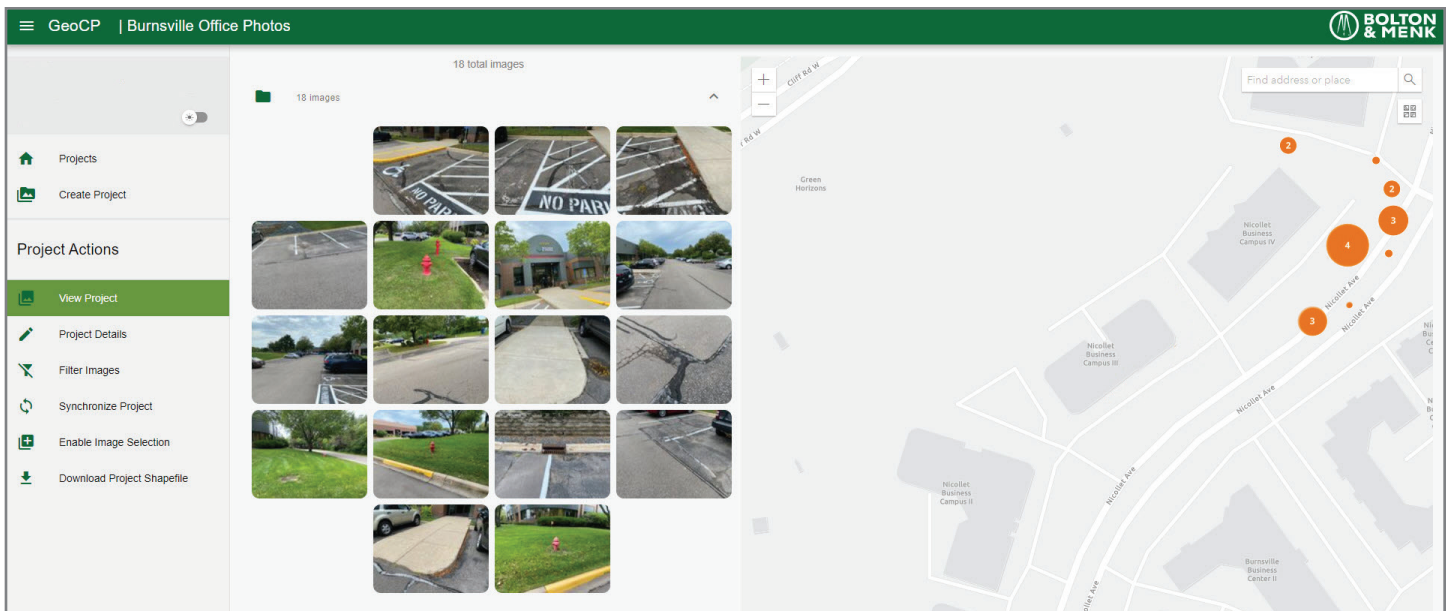

GeoCP™ creates a web-based application that allows for public sharing. All images are available internally and can be shared with viewing capabilities externally. Save yourself time and effort of thumbing through photos on a server and start viewing them through GeoCP™.

Easy and Efficient

GeoCP™ is supported by all web browsers and no additional software is required. The application increases research efficiency among different locations, while keeping all project records intact.
